ABSTRACT
Partnering with parents and children in the design process can be important for producing technologies that take into consideration the rich context of family life. However, to date, few studies have examined the actual process of designing with families and their children. Without understanding the process, we risk making poor design choices in user-experience experiences that take into account important family dynamics. The purpose of this investigation is to understand how parent-child relationships in families shape co-design processes and how they are reshaped through co-design. We document the evolutionary process and outcomes that exist in co-design partnerships between researchers and families. We found that parents' engagement patterns shifted more slowly than that of children's from observing and facilitating to design partnering practices. Our analysis suggests the importance of establishing and nurturing social bonds among parents, children, and researchers in the co-design process.

INTRODUCTION
Interviewer: What do you think about designing with the adults, like with your parents?

Amy: I think that sometimes we don't agree on things. But I think it's kind of fun because you get to bond with your parents and we get to see like what ideas are cool and like, I can design things with my family.

(Received 19 December 2013; accepted 8 September 2014)

This paper describes the development of *ScienceKit*, a mobile, social media application to promote children's scientific inquiry. We deployed *ScienceKit* in *Kitchen Chemistry (KC)*, an informal science program where children learn about scientific inquiry through cooking. By iteratively integrating design and implementation, this study highlights the affordances of social media that facilitate children's trajectories of disposition development in science learning. We illuminate how the technological and curricular design decisions made in *ScienceKit* and *KC* constrain or expand the types of data we can collect and the actionable insights about learning we can recognize as both educators and researchers. This study offers suggestions for how information gleaned from social media tools can be employed to strengthen our understanding of *learning in practice*, and help educators better recognize the rich actions that learners undertake, which may be easily overlooked in face-to-face situations.

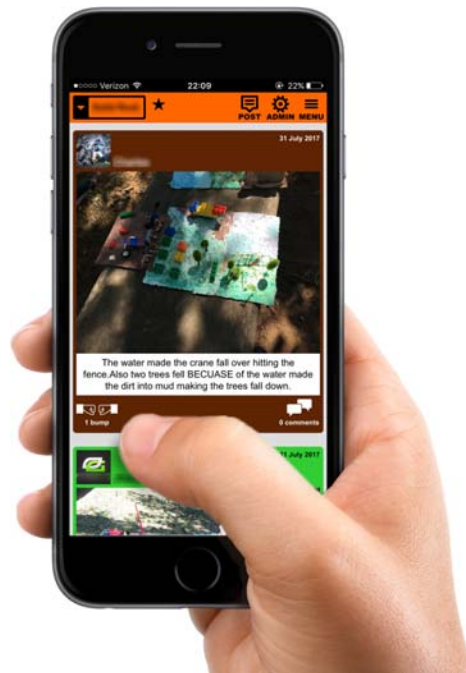

Keywords: social media; science dispositions; data-informed instruction

Introduction

Social media applications are a ubiquitous part of young people's lives and substantially influence how individuals relate to one another, share information, and engage with the world (Ahn 2011; Grimes and Fields 2012; Madden et al. 2013). Different social media platforms – for example, social network sites, micro-blogs, wikis, or media-sharing platforms – allow members to share text, images, video, and other digital media. Researchers observe that individuals use these technical features to establish a variety of social and cultural practices. For instance, social media tools significantly influence how people interact socially and share information (Lewis, Pea, and Rosen 2010; Morris, Teevan, and Panovich 2010). Similarly, there has been
