Cultivating Creativity to Integrate Computation and Science Problem Solving in Informal Learning

H. Chad Lane, Brian Guerrero, Jeff Ginger, Kriti Mathur, & Win Lawson

NSF Award Number: 1934087

Dates: 2019-2023

Project type: ETD-equivalent (originally funded through STEM+C)

Project URL: <https://publish.illinois.edu/stemc-minecraft/>

Project Overview: We investigate the design of a Minecraft-based integrated learning environment for computational thinking, creative scientific problem solving, and data science. Research focuses on knowledge gains and changes in interest in STEM.

Minecraft is an effective and motivating environment for the acquisition of coding skills and creative scientific problem solving for middle school STEM learning.

Lessons Learned & Insights Gained

- STEM-based problem prompts in a game environment lead to high levels of engagement (as compared to, say, programming math equations).
- Learners rapidly learned a real-world programming language (Lua): Average 11% gain in knowledge/skill occurred in between 6-10 hours of contact time.
- Computational creativity as a strategy to extend human capability was evident in several dimensions, kids enjoyed having a new power to affect the world

Equity

- We have taught over 50 diverse participants in Illinois, California, and Colorado to code creatively during camps/afterschool events.
- Our content provides a wide range of choices for interest-driven learning. Projects are self-selected from across STEM subject areas with a high degree of customization and personalization possible throughout the experience.

New Challenges & Next Steps

- Next challenge: integrate data science with current Science+CT content. How can we integrate data collection, analysis, and visualization skills in Minecraft?
- What are the best methods to analyze learner code and in-game behaviors?
- Flexible and effective computational creativity takes time, how can this be achieved in a combined formal/informal learning context?
